Analyses Completed Using Title V Block Grant Funds

## Study Objective

This study sought to describe maternal characteristics and differences in the risk of delivering a low birthweight (LBW) infant among eight Asian subgroups living in California.

There are 18.5 million Asian Americans, Native Hawaiian, and Pacific Islanders (AA, NHPI) in the U.S.

The AA and NHPI community is very diverse with more than 50 race/ethnic groups who speak over 100 different languages.

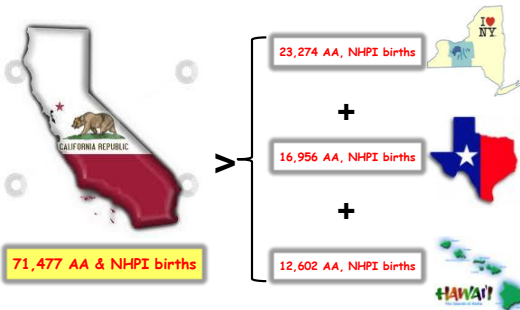

Data source: U.S. Census Bureau, Overview of Race and Hispanic Origin, 2010, March 2011. <http://www.census.gov/prod/2010br01/or02.pdf>

Nearly one-third of the Asian, Native Hawaiian, and Pacific Islanders live in California.

Data source: U.S. Census Bureau, Overview of Race and Hispanic Origin, 2010, March 2011. <http://www.census.gov/prod/2010br01/or02.pdf>

In 2009, the largest number of births to Asian American, Native Hawaiian, and Pacific Islander women occurred in California followed by New York, Texas and Hawaii.

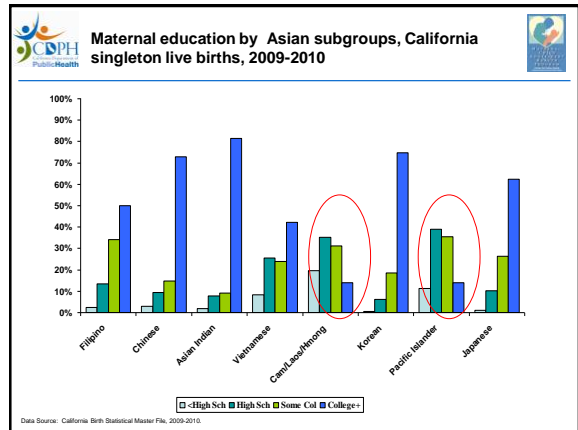

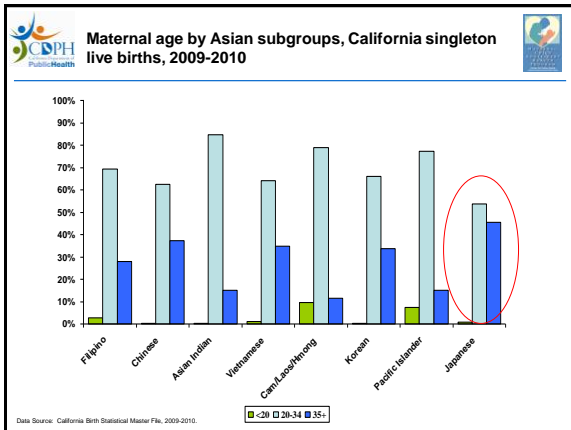

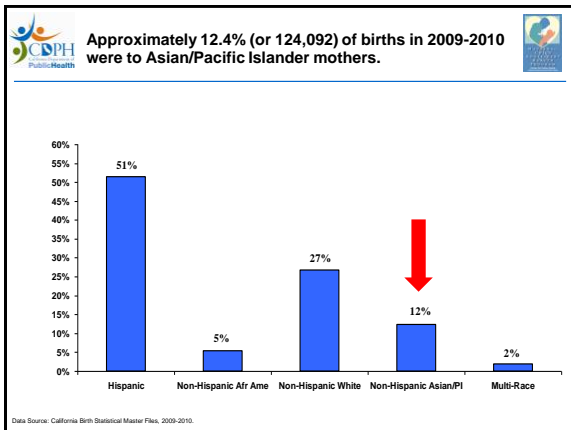

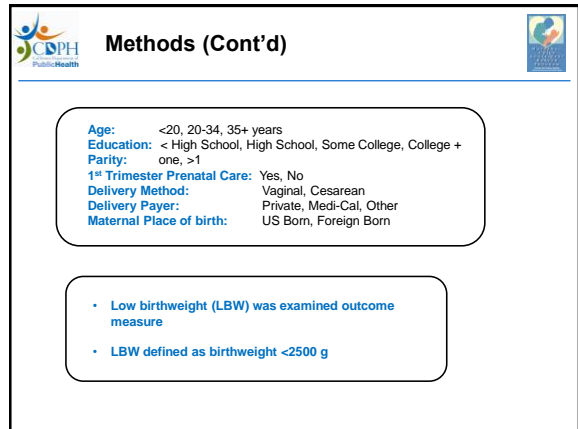

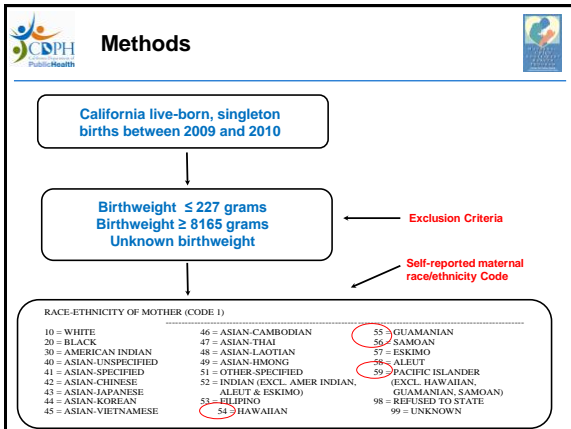

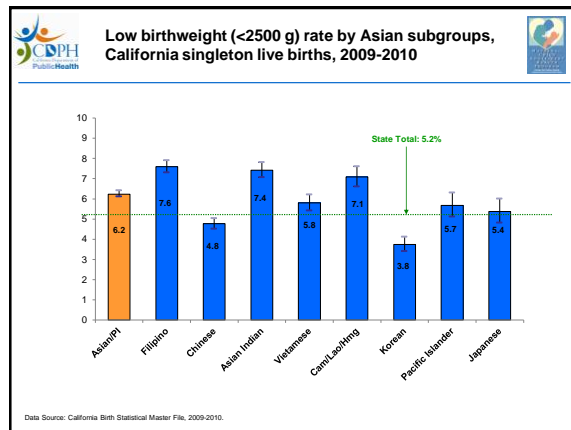

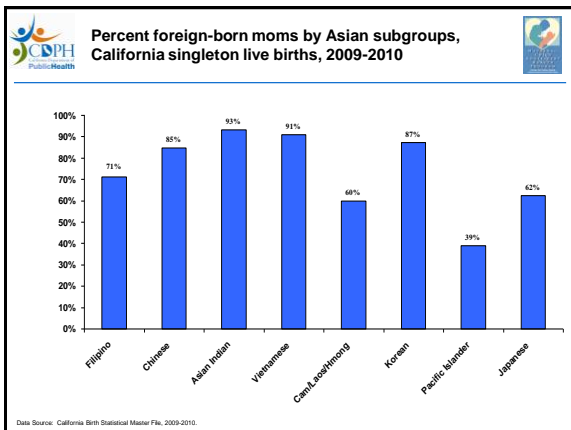

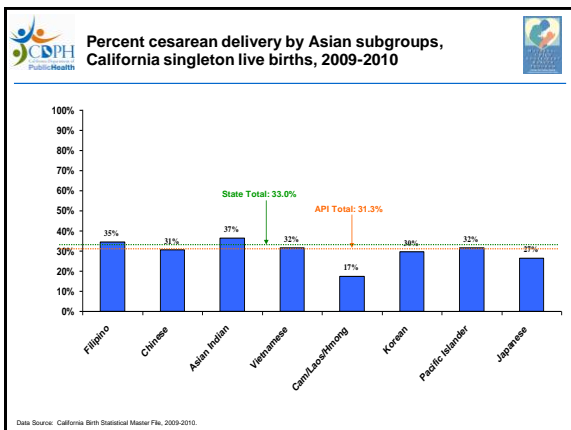

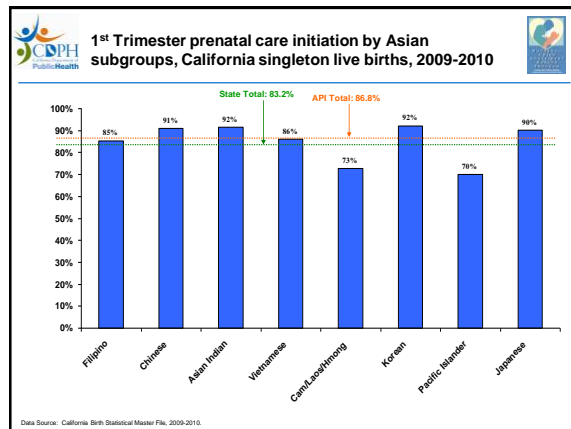

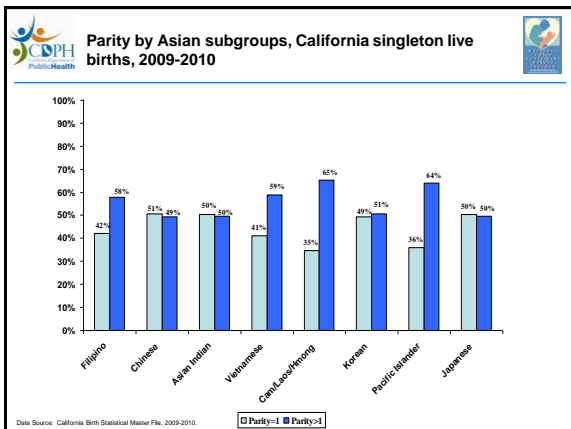

Data Source: Martin JA, Hamilton BE, Ventura SJ, Osterman MK, Kirmeyer S, Mathews TJ, Wilson EC. Births: Final data for 2009. National vital statistics reports. [http://www.cdc.gov/nchs/data/series/r18/r18\\_045a.pdf](http://www.cdc.gov/nchs/data/series/r18/r18_045a.pdf)

Factors facing the Asian American, Native Hawaiian, Pacific Islander Community

- Disparities in access to quality care and use of health care exist for Asian American, Native Hawaiian, and Pacific Islander women and their infants.
- Family characteristics, socioeconomic and geographic contexts, as well as social factors may also account for variation in outcomes.
- Individual, familial, and cultural traditions surrounding pregnancy and childbirth are important to providing services that are culturally and linguistically meaningful.

### Multivariate Logistic Regression Analysis: Asian Indian and Filipinos are twice as likely to have LBW infants.

Asian Subgroups (reference = White)	Adjusted Odds Ratio	95% Confidence Interval	
		Lower	Upper
Chinese	1.35	1.25	1.45
Cambodian/Lao	1.91	1.75	2.08
Filipino	2.18	2.06	2.31
Asian Indian	2.32	2.17	2.50
Japanese	1.56	1.36	1.79
Korean	1.08	0.96	1.21
Pacific Islander	1.39	1.22	1.59
Vietnamese	1.60	1.47	1.73

Controlling for: maternal age, education, parity, 1<sup>st</sup> trimester prenatal care, delivery payer, maternal place of birth, and delivery method.

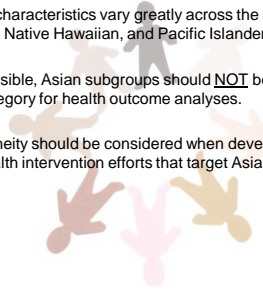

Data Source: California Birth Statistical Master File, 2009-2010.

### Conclusion & Public Health Implications

- Maternal characteristics vary greatly across the different Asian American, Native Hawaiian, and Pacific Islander subgroups.
- When possible, Asian subgroups should **NOT** be grouped into a single category for health outcome analyses.
- Heterogeneity should be considered when developing clinical and public health intervention efforts that target Asian subgroups.

### Limitations and Next Steps

- Absence of some data, and the quality of data in the birth file.
- Further analyses with more detailed survey instrument, such as the California Maternal Infant Health Assessment (MIHA) could improve our knowledge of subgroup variation in risk factors.
- Linking the birth file with hospital discharge data could also help understand maternal health at the time of delivery which may impact birth outcomes.
